

MySQL RDBMS

Trainer: Mr. Nilesh Ghule

MySQL data types

- RDBMS have similar data types (but not same).
- MySQL data types can be categorised as follows

MySQL: INT, DECIMAL, FLOAT
Oracle: NUMBER
DERBY: INTEGER

- ① Numeric types (Integers) $\rightarrow \pm 2^{15}$ $\rightarrow \pm 2^{23}$ $\rightarrow \pm 2^{31}$ $\rightarrow \pm 2^{63}$
 - TINYINT (1 byte), SMALLINT (2 byte), MEDIUMINT (3 byte), INT (4 byte), BIGINT (8 byte), BIT(n bits)
 - integer types can signed (default) or unsigned.
- ① Numeric types (Floating point) $\rightarrow 0$ to 2^{16} $\rightarrow 0$ to 2^{32}
 - approx. precision – FLOAT (4 byte), DOUBLE (8 byte) | DECIMAL(m, n) – exact precision
- ① Date/Time types \rightarrow IEEE-754 format
 - DATE, TIME, DATETIME, TIMESTAMP, YEAR
- ① String types – size = number of chars * size of char
 - CHAR(1-255) – Fixed length, Very fast access.
 - VARCHAR(1-65535) – Variable length, Stores length + chars.
 - TINYTEXT (255), TEXT (64K), MEDIUMTEXT (16M), LONGTEXT (4G) – Variable length, Slower access.
- ① Binary types – size = number of bytes \rightarrow images, pdf, docs, ...
 - BINARY, VARBINARY, TINYBLOB, BLOB, MEDIUMBLOB, LOB
- ① Miscellaneous types \rightarrow like text.
 - ENUM, SET

create table t1 (c1 smallint unsigned, c2 int unsigned);

create table t2 (col decimal(8,3));

1 2 3 4 5.6 7 8
← 3 →
← 8 →

Size of char
depend on charset
① ASCII \rightarrow 1 byte
② Unicode \rightarrow 2 bytes
③ EBCDIC \rightarrow 4 bytes (mBCS)

CHAR vs VARCHAR vs TEXT

• CHAR

- Fixed inline storage.
- If smaller data is given, rest of space is unused.
- Very fast access.

• VARCHAR

- Variable inline storage.
- Stores length and characters.
- Slower access than CHAR.

• TEXT

- Variable external storage.
- Very slow access.
- Not ideal for indexing.

- CREATE TABLE temp(c1 CHAR(4), c2 VARCHAR(4), c3 TEXT(4));
- DESC temp;
- INSERT INTO temp VALUES('abcd', 'abcd', 'abcdef');

INSERT – DML

- Insert a new row (all columns, fixed order).
 - INSERT INTO table VALUES (v1, v2, v3);
- Insert a new row (specific columns, arbitrary order).
 - INSERT INTO table(c3, c1, c2) VALUES (v3, v1, v2);
 - INSERT INTO table(c1, c2) VALUES (v1, v2);
 - Missing columns data is NULL.
 - NULL is special value and it is not stored in database.
- Insert multiple rows.
 - INSERT INTO table VALUES (av1, av2, av3), (bv1, bv2, bv3), (cv1, cv2, cv3).
- Insert rows from another table.
 - INSERT INTO table SELECT c1, c2, c3 FROM another-table;
 - INSERT INTO table (c1,c2) SELECT c1, c2 FROM another-table;

Thank you!
